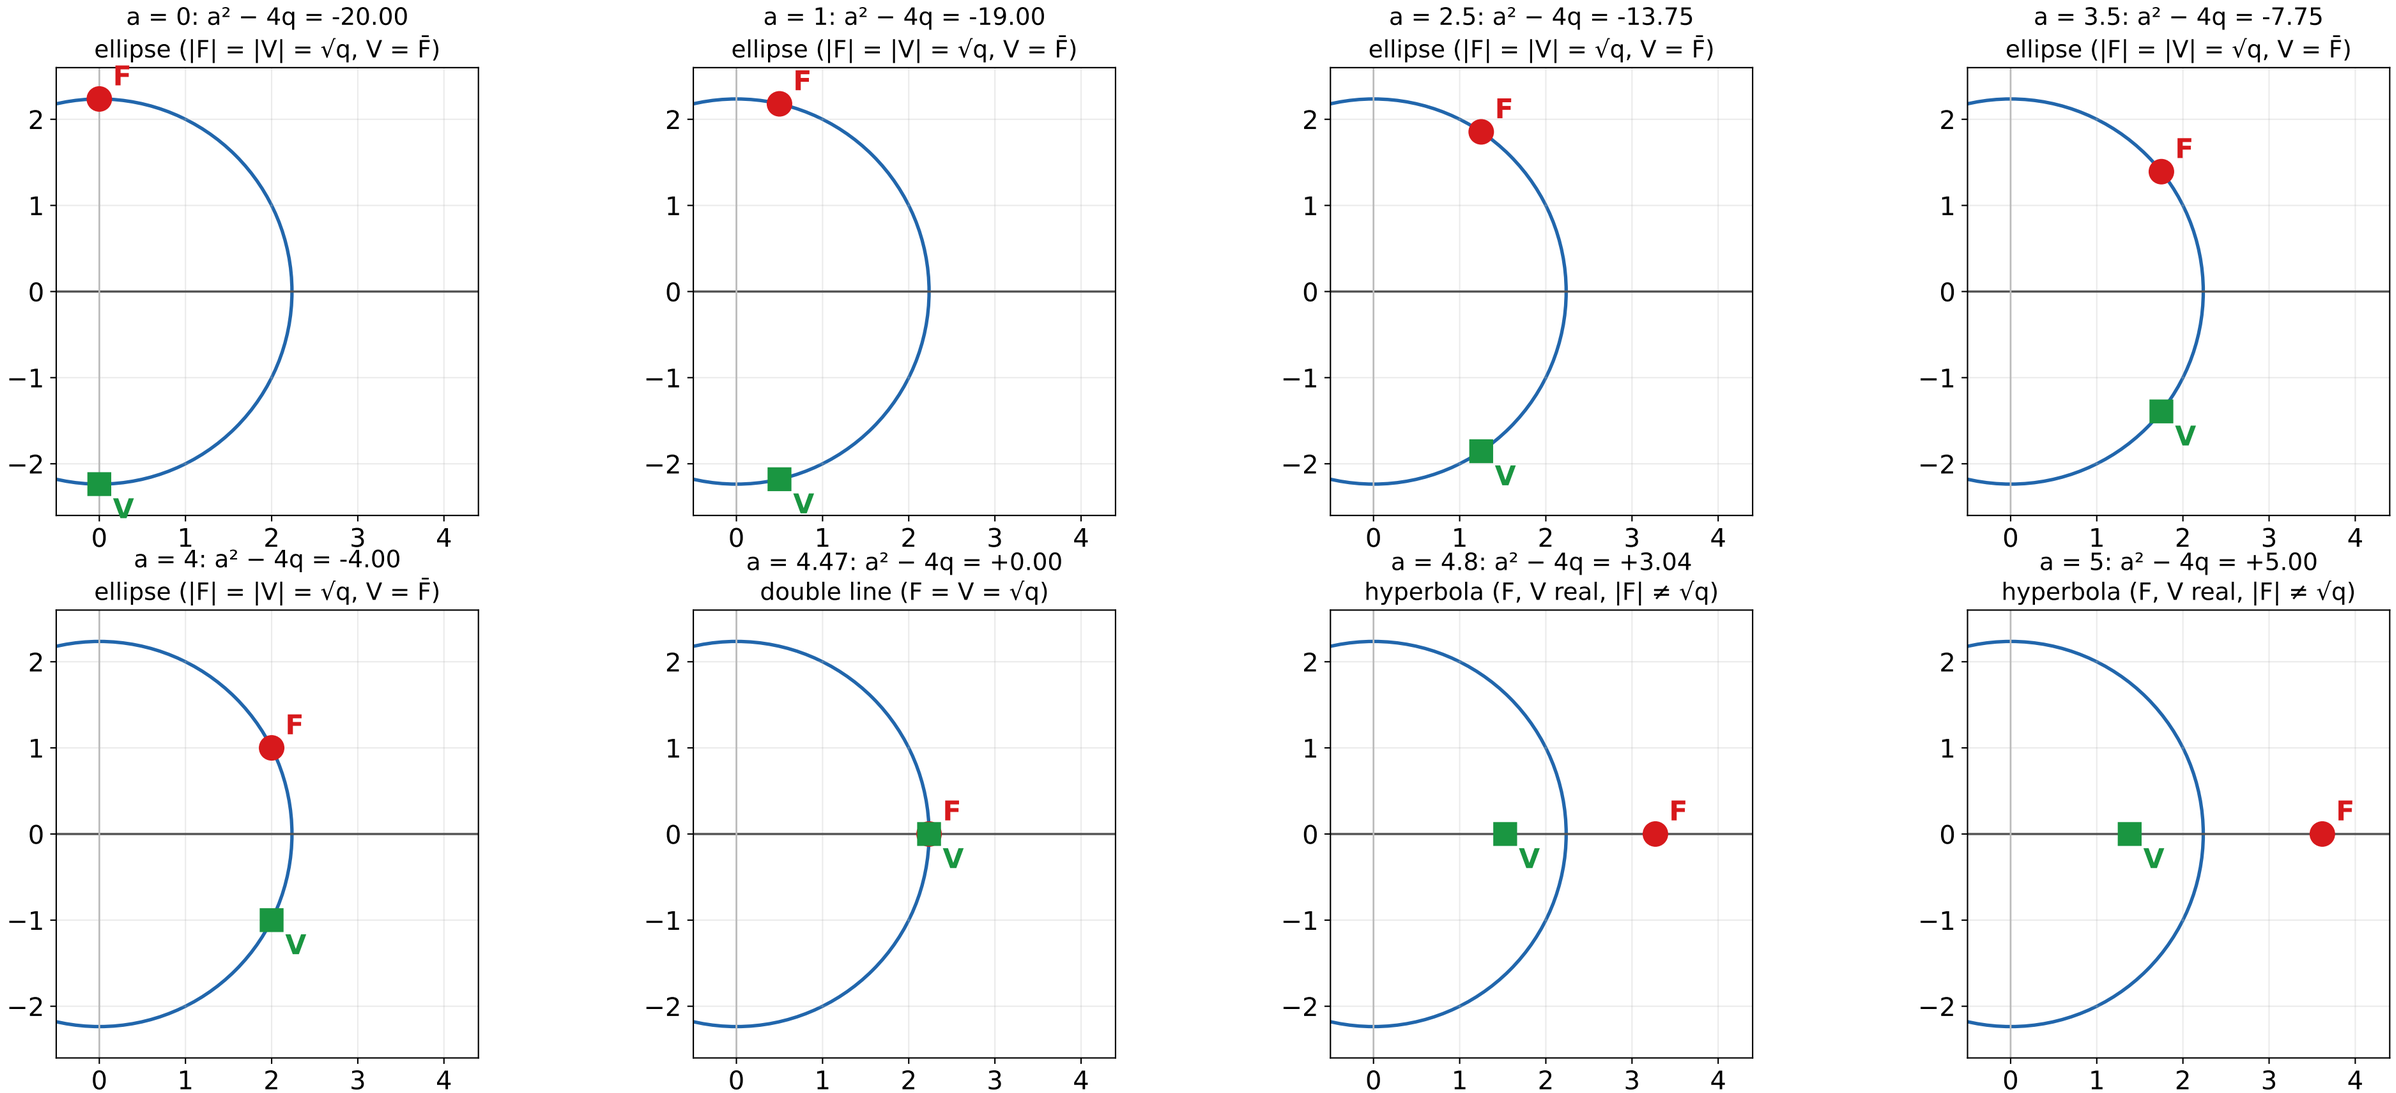
Frobenius F and Verschiebung V as the roots of x² − a·x + q (q = 5)
conjugate on |z| = √q while a² < 4q, meeting at a² = 4q, splitting onto the real axis when a² > 4q



[Theorem] FV = VF = q, F + V = a; a² < 4q ⇒ V = F̄ ⇒ |F|² = FV = q (Hasse).
blind] every fake keeps FV = q. [Restatement] the RH-type statement is V = F† for a POSITIVE form (Rosati). a = 1: 11a1 at p = 5; a = 5: the TAA Lemma 152 fake; other a are illustrative. [Analogy] J. W. McGreevy's animation as this
