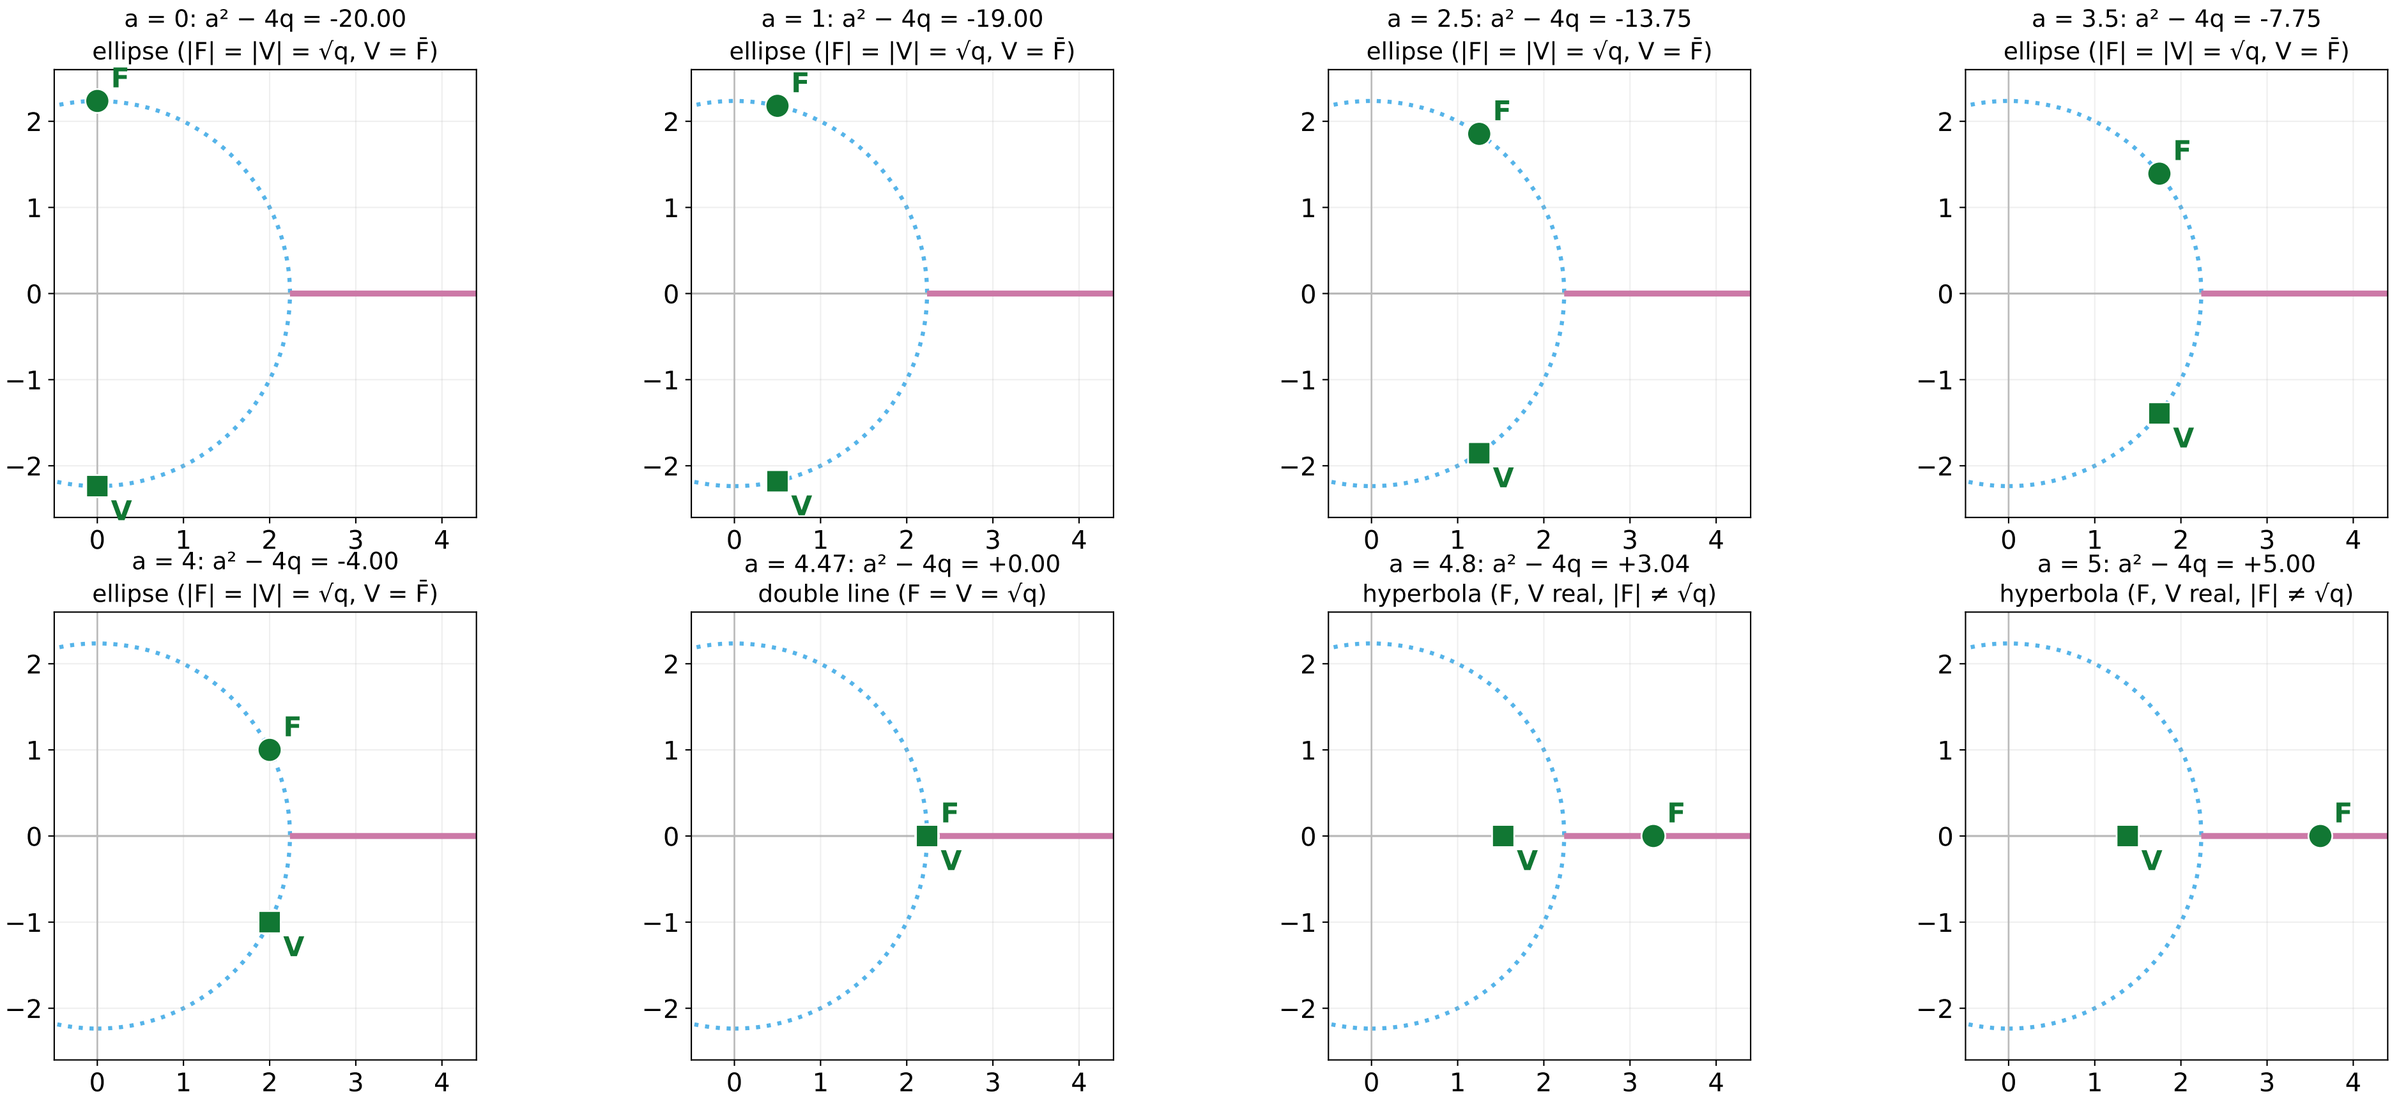
Frobenius F (●) and Verschiebung V (■) as the roots of $x^2 - a \cdot x + q$ ($q = 5$)
conjugate on the ring $|z| = \sqrt{q}$ while $a^2 < 4q$, meeting at $a^2 = 4q$, split onto the real axis (purple) when $a^2 > 4q$



[Theorem] $FV = VF = q$, $F + V = a$; $a^2 < 4q \Rightarrow V = \bar{F} \Rightarrow |F|^2 = FV = q$ (Hasse).
[Restatement] the RH-type statement is $V = F\dagger$ for a POSITIVE form (Rosati); every fake keeps $FV = q$. $a = 1$: 11a1 at $p = 5$; $a = 5$: the TAA Lemma 152 fake; other a illustrative.
