Stage 3 — The pure wedge: a² = 4q

deg = (m − √5·n)²: rank 1, the conic is a doubled line at atan(1/√5) ≈ 24° — not 45°.

F and V: roots of x² − ax + q

[Theorem]

Wedge: the doubled line

a² = 4q: deg = (m − (a/2)·n)²

[Theorem]

Every disk: Critical line (y-axis) · Nested rings (weight strata) · Origin ↔ infinity (the cusp)

Colours = concepts (see legend.png); grey [badge] = status. No null rays at 45° (per J. W. McGreevy); lobes are elliptical conic sections, not elliptic curves.

After J. W. McGreevy's animation 'Flat Potential Oscillations' (Aug 2025, x.com/McGreevyMD/status/1951474097990279331). Re-rendered by Grok Bot from the analysed geometry; not J. W. McGreevy's code. RH is not proved.
