Stage 4 — Hyperbolic window: an indefinite block (a ghost)

Fake Weil polynomial $x^2 - 5x + 5$ at $q = 5$ ($a^2 = 25 > 20$). Purple: where deg < 0 — impossible for a real curve.

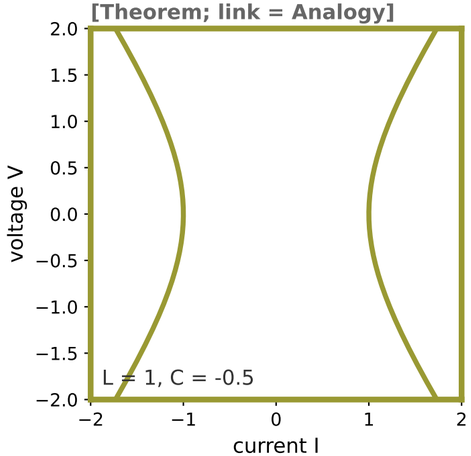

Hyperbolic window = a ghost
$a^2 > 4q$; DH: $\gamma \approx 85.70, 114.16$
[Theorem for fakes; DH = Numerical]

Null rays bound the window
$m = r \cdot n$, $r = 3.618, 1.382$
[Theorem]

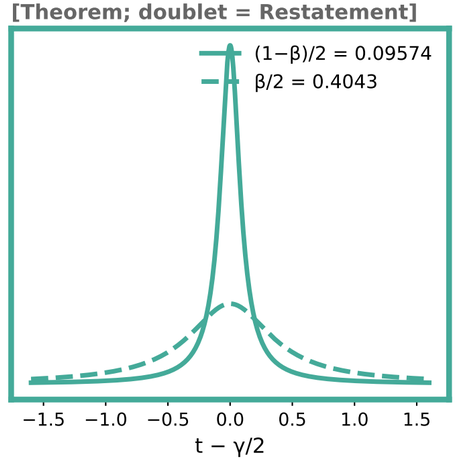

F and V: roots of $x^2 - ax + q$
[Theorem]

LC energy: hyperbola
[Theorem; link = Analogy]

Resonance doublet (DH ghost 1)
[Theorem; doublet = Restatement]

Every disk: Critical line (y-axis) · Nested rings (weight strata) · Origin ↔ infinity (the cusp)

Colours = concepts (see legend.png); grey [badge] = status. No null rays at 45° (per J. W. McGreevy); lobes are elliptical conic sections, not elliptic curves.

After J. W. McGreevy's animation 'Flat Potential Oscillations' (Aug 2025, x.com/McGreevyMD/status/1951474097990279331). Re-rendered by Grok Bot from the analysed geometry; not J. W. McGreevy's code. RH is not proved.
