Stage 5 — The 180° half turn: polarity flip

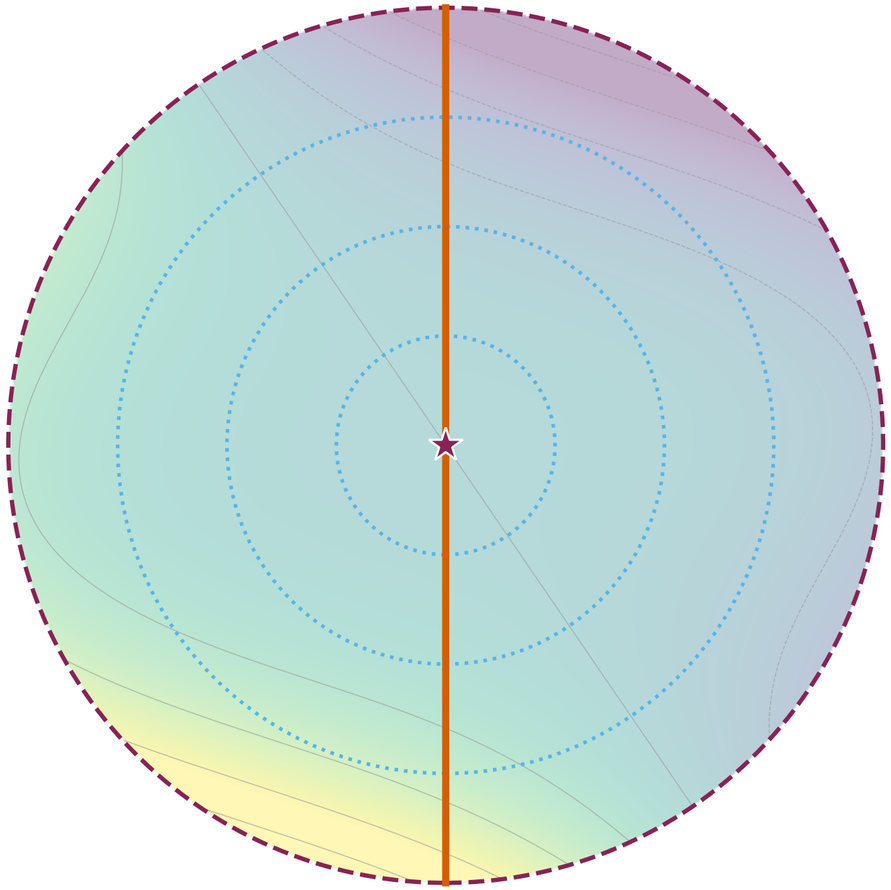

An odd field f(v) = deg(v)·⟨v,u⟩ (weight 3) under v ↦ −v: colours swap, level curves stay.

Half turn flips the sign
$S^2 = -I$; F ↔ V; Hardy Z flips
[Restatement]

before: f(v)

after the 180° turn: f(−v) = −f(v)

Every disk: Critical line (y-axis) · Nested rings (weight strata) · Origin ↔ infinity (the cusp)

Colours = concepts (see legend.png); grey [badge] = status. No null rays at 45° (per J. W. McGreevy); lobes are elliptical conic sections, not elliptic curves.

After J. W. McGreevy's animation 'Flat Potential Oscillations' (Aug 2025, x.com/McGreevyMD/status/1951474097990279331). Re-rendered by Grok Bot from the analysed geometry; not J. W. McGreevy's code. RH is not proved.
