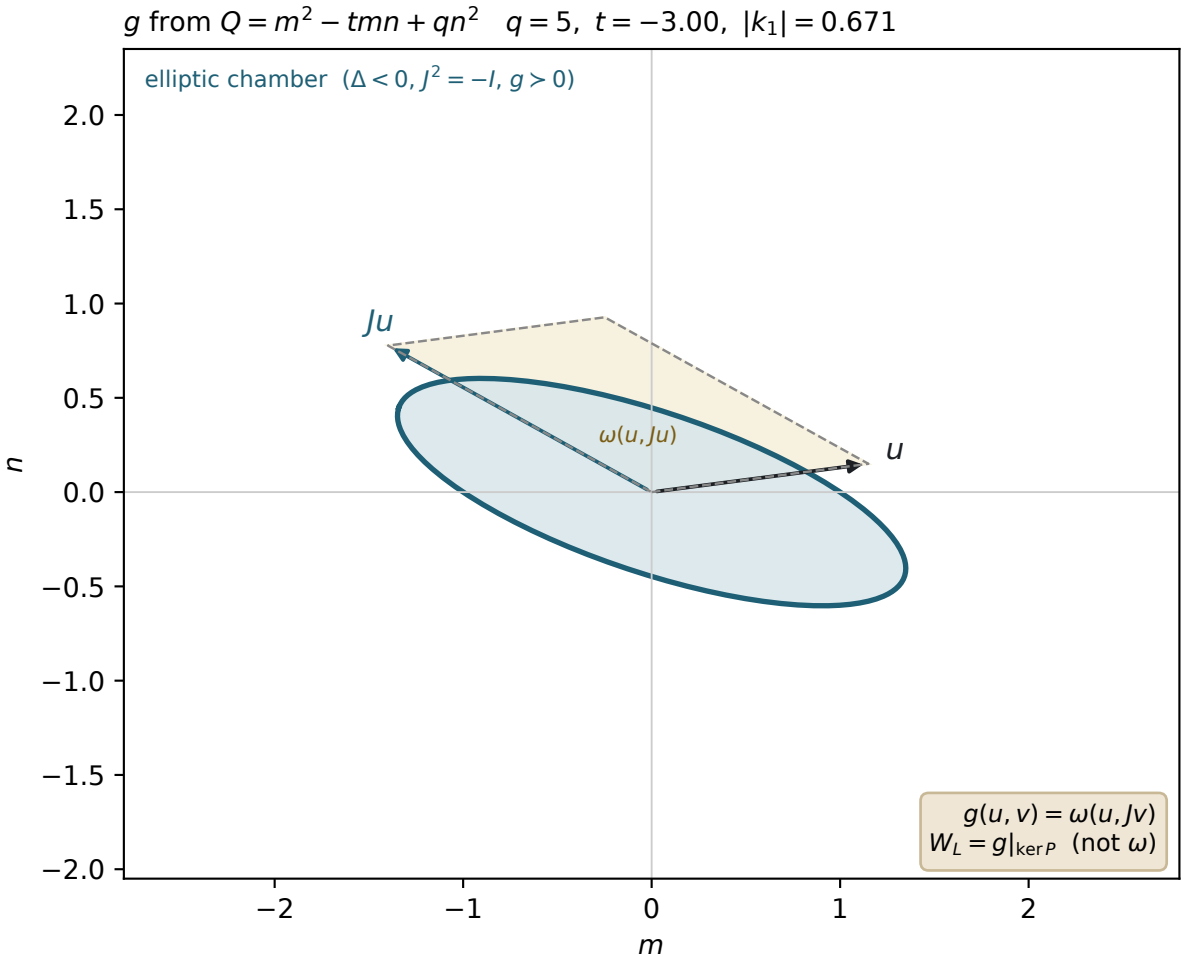
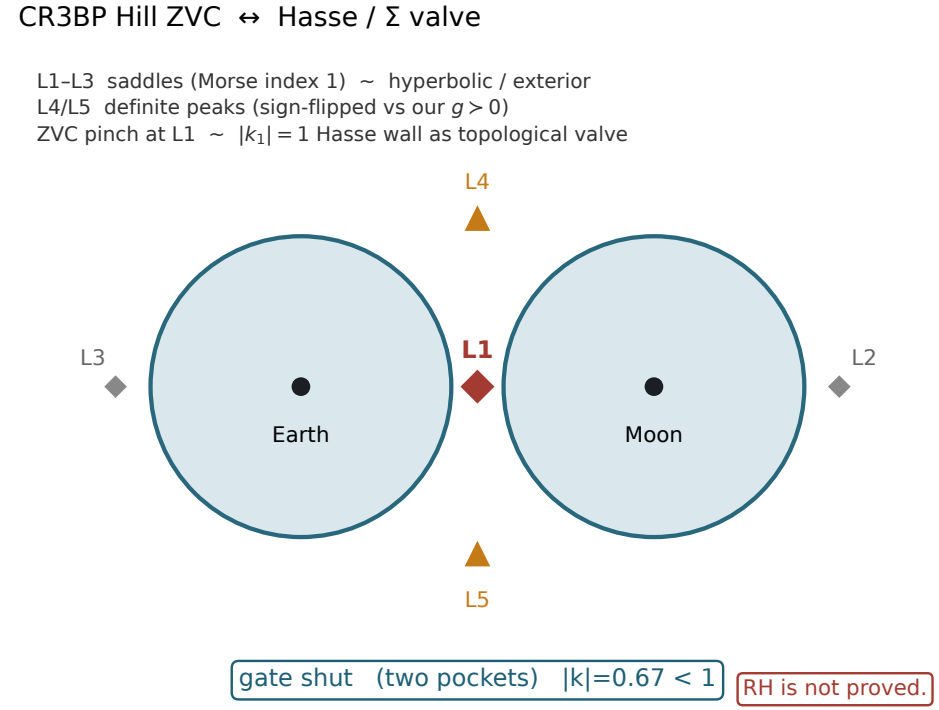
Fig B. (P) is the symmetric partner g of a skew form ω, glued by a compatible J — not ω itself




Canonical symplectic $\omega = dp \wedge dx$ is a name collision with the Weil form W_L (Numerology ~1.2). W_L is Hermitian/symmetric: $W_L = g|_{\ker P}$, $g(u,v) = \omega(u, Jv)$. Rank 1 stays kahler_triple_polarization.
